SUMMARY

Linux/DevOps engineer with about ten years in infrastructure and integration work, mostly for banks and mid-size tech companies. The last few years have been Kubernetes, CI/CD and Python integration glue between monitoring, ticketing and deployment systems. Since 2021 I've also been doing Salesforce DevOps (Apex, SFDX, Copado), and over the past year I've picked up n8n/GPT-4 based automation for things like incident triage and release notes. Comfortable owning something end to end - from the Terraform that provisions it to the Python that keeps it talking to everything else.

SKILLS

Scripting: Python, Bash, Apex, SOQL

Cloud / containers: AWS (EKS, Lambda, S3, SQS), Azure (AKS, DevOps), Kubernetes, Docker, Helm

IaC & CI/CD: Terraform, Ansible, GitLab CI, Jenkins, Git, GitOps

Systems & networking: Linux (RHEL), VMware, KVM, Cisco ASA, Palo Alto, F5

Monitoring: Prometheus, Grafana, Nagios, Zabbix, ELK

Security: CIS hardening, SIEM, IDS/IPS, WAF, Nessus, pen testing basics, exploit development basics, AD attack techniques

Salesforce: Admin, Apex/LWC, SFDX, Copado, metadata & bulk API deployments

Automation / AI tooling: n8n, Zapier, OpenAI API, ClickUp

Languages: English, Russian, Turkish (fluent) · Azerbaijani (native) · German (basic)

EXPERIENCE

Linux/DevOps Engineer - Integration & Automation — ABB - Azerbaijan International Bank

Baku, Azerbaijan | 2023 - Present

- Built a Python service that feeds Nagios/Prometheus alerts into our ITSM ticketing system - handles most of the day-to-day event correlation that used to be manual.
- Run our Kubernetes workloads (on-prem plus Azure AKS) with Helm and GitOps; moved autoscaling off plain CPU metrics onto custom Prometheus signals.
- Rewrote the GitLab CI pipelines into proper stages - build, test, security scan, deploy - so releases run the same way every time.
- Wrote the Terraform/Ansible stack we use for provisioning Azure and on-prem resources, so new environments don't need manual setup anymore.
- Set up Prometheus + Grafana with alerting into Slack/PagerDuty, so on-call gets alerts with context instead of raw noise.
- Handle CIS benchmark hardening and compliance scanning on the systems we get audited on.

Salesforce DevOps Engineer — ITG

Lithuania (remote) | 2022 - 2023

- Set up CI/CD for multi-org Salesforce deployments (Copado, Git, Bitbucket) and wrote the branching strategy the team still uses.
- Automated data migrations and cross-org syncs with Python against the Metadata and Bulk APIs.
- Owned sandbox refreshes and the code-quality/security gates before anything went to production.
- Worked with SFDX scratch orgs and unlocked packages to make deployments more modular.

Salesforce DevOps Engineer — Persistent Systems

Remote | 2021 - 2022

- Built real-time integrations between Salesforce and third-party systems (REST/SOAP, middleware) for a unified customer view across CRM and ERP.
- Wrote Apex REST services and platform events for two-way integrations, and handled releases across several orgs.
- Built some Lightning Web Components and Visualforce pages; wrote Apex tests alongside the code.
- Configured Connected Apps and OAuth for secure API access against our identity provider.

DevOps / Security Engineer — Vebtech

Minsk, Belarus | 2020 - 2021

- Added SAST/DAST/SCA scanning into the CI/CD pipeline.
- Ran internal and external pen tests plus a few red-team exercises; configured IDS/IPS, SIEM and WAF rules.
- Automated hardening and access-control checks with Python/Ansible.
- Ran vulnerability scans (Nessus, OpenVAS) across our servers and tracked remediation through to close.

DevOps Engineer - Kubernetes — LogicLike

Minsk, Belarus | 2020

- Deployed and ran Kubernetes clusters on EKS and on-prem, using Jobs/CronJobs for batch workflows.
- Set up custom-metric autoscaling tied to queue depth, so idle capacity scaled down when queues were empty.
- Built the multi-AZ AWS networking behind it (VPC, NAT, ALB).

System Engineer - Cloud Integration — EPAM Systems

Minsk, Belarus | 2018 - 2020

- Built Python microservices for event-driven pipelines on AWS (S3, SQS, Lambda, RDS).
- Set up EventBridge automation connecting many internal systems.
- Built CI/CD (Git to Jenkins to Docker to Kubernetes) with blue/green deploys and automatic rollback.
- Wrote Terraform/CloudFormation for our AWS/Azure footprint and added SAST/DAST/SCA gates.

Systems & Infrastructure Specialist — Yapi Kredi Bank

Baku, Azerbaijan | 2015 - 2018

- Administered VMware/KVM environments and the network stack (Cisco ASA/ISE, F5, Palo Alto).
- Supported PCI DSS and GDPR compliance - audits, scans, remediation follow-up.
- Set up DR/backup with Veritas NetBackup, for Tier-1 banking systems.
- Managed a large fleet of Linux servers - patching, capacity planning, on-call for banking systems.

Linux/Unix Administrator — SMART Technologies

Baku, Azerbaijan | 2014 - 2015

- Deployed and hardened Linux servers - SSH and firewall configuration, user access.
- Wrote Bash/Python scripts for routine maintenance and set up Nagios monitoring.

ADDITIONAL PROJECTS

IOP - infrastructure & security platform
FastAPI/MongoDB/React app for IP management, RBAC + LDAP auth, real-time firewall investigation, nightly sync from Device42/Zabbix/Palo Alto/vCenter. github.com/rhelsenseizamiq/IOP

CIS benchmark CLI
Python tool that audits AWS/Azure/GCP against CIS benchmarks and outputs HTML/Excel/Markdown reports. github.com/rhelsenseizamiq/cis-benchmark

SecureVault
Encrypted credential vault (AES-256) with a bundled SSH fleet client built on Paramiko. github.com/rhelsenseizamiq/SecureVault

AI-powered incident response automation
n8n workflow that takes Prometheus/Grafana webhook alerts, pulls in host metadata and recent logs, and sends the whole thing to GPT-4 for a root-cause guess and a suggested fix. P1s ping Slack and PagerDuty right away; P2/P3s just become a ClickUp task with an AI-written description. On-call gets a pre-analysed ticket instead of a raw alert.

Multi-source data pipeline with AI categorisation
Zapier triggers on several source systems feeding an n8n workflow that batches records, sends them to OpenAI for classification, and writes the results into ClickUp plus a Google Sheets dashboard. Runs on its own now.

DevOps runbook / knowledge base assistant
Slack messages tagged for the #runbook channel get pulled into n8n, sent to GPT-4 with a prompt that extracts the problem, the steps, and the affected systems, and turned into a ClickUp doc automatically. A second workflow watches incoming alerts and proactively surfaces matching runbooks in the thread.

CI/CD release notes generator
Fires on PR merge - n8n grabs the diff and commit history from GitHub/GitLab, sends it to GPT-4 for a plain-English changelog and a risk assessment, then posts it to the linked ClickUp task and, optionally, a Slack channel. Automates the changelog that is usually written by hand.

PROFESSIONAL CERTIFICATIONS PORTFOLIO

Salesforce

- **Salesforce Certified Administrator (ADM-201)** — Org setup, security model, automation with Flow, reporting.
- **Salesforce Certified Platform Developer I (PD1)** — Apex, Visualforce, governor limits, testing and deployment.
- **Salesforce Certified Sharing and Visibility Architect (Architect track)** — Designing sharing/OWD models for large multi-business-unit orgs.

Cloud

- **AWS Certified Solutions Architect - Associate (SAA-C02)** — Core AWS services, HA/DR design, cost optimisation.

Linux

- **LPIC-1 (101-500 / 102-500)** — Day-to-day Linux administration.
- **LPIC-2 (201-450 / 202-450)** — Networking services, kernel, storage.
- **LPIC-3 (300 / 303 / 304)** — Enterprise Linux - LDAP, HA clustering, virtualisation.
- **Oracle Linux OCA (1Z0-100)** — Oracle's RHEL-compatible distro and tooling.

Networking

- **CCNA (200-301)** — Routing/switching fundamentals plus basic network automation.

Security

- **Tenable Certified Nessus Auditor** — Vulnerability scanning and compliance auditing with Nessus.
- **Certified Ethical Hacker (CEH v12)** — Standard pen-testing methodology and attacker TTPs.

EDUCATION

BSc, Computer Engineering - Qafqaz University, Baku (2009 - 2015)
